VoC Intelligence Platform

Turning ecommerce reviews into revenue decisions

An end-to-end product case study — from problem framing and solution architecture to UX decisions and a working wireframe — built as an internship assignment.

Role	Type	Timeline	Output
Product Designer / PM Candidate	Internship Assignment	Single sprint (1 session)	Wireframe HTML Dashboard

CONTEXT

01 Problem Statement

> *"We are a software company and we want to build a solution for an Ecommerce Brand Owner — they keep getting thousands of reviews on multiple online platforms every single month."*

On the surface this reads as a review management problem. But the real pain isn't volume — it's signal loss. Brand owners aren't drowning in reviews; they're drowning in unstructured noise that blocks confident product and business decisions.

Core tensions identified:

- Reviews scattered across 3–5 platforms with no unified view
- No way to distinguish a revenue-threatening complaint from a one-off rant
- Responses are reactive, not strategic — owners reply to what they see, not what matters
- Competitive intelligence is completely absent from the current workflow

INSIGHT

02 Reframing the Problem

The most important product decision here wasn't a feature — it was a reframe.

The initial instinct was to build a review management system: aggregate, filter, respond. That's table-stakes. After deeper analysis the framing shifted entirely:

Surface Problem	Reframed Problem
Too many reviews to manage	No system to convert customer voice into decisions
Need to reply faster	Need to act on what actually impacts revenue
Want sentiment analysis	Want to know: what should I fix first, and why?
Competitor mentions in reviews	Market intelligence hiding in plain sight

This reframe changed everything downstream — product structure, KPIs, feature hierarchy, and what appears above the fold.

USER

03 Who Is This For?

A deliberate MVP decision was made to serve one primary user: the ecommerce brand owner. Not support agents, not data teams.

Persona	Primary User — Ecommerce Brand Owner
Context	Sells on 2–5 platforms. Receives 500–5,000+ reviews/month. No dedicated analytics team.
Goal	Understand what customers are saying, act on what matters, grow revenue.
Frustration	Can't separate critical complaints from flukes. Hours lost reading reviews manually. No visibility into competitor perception.
Mental Model	Thinks in business outcomes — not features, not AI jargon.

SOLUTION

04 Solution Architecture

Positioned as a **Voice of Customer Intelligence Platform** — not a review tool. The distinction matters for pricing, positioning, and every product decision.

Layer	What It Does	Why It Matters
Data Aggregation	Pulls reviews from Amazon, Flipkart, Myntra + social mentions via API	Single source of truth — no more platform-switching
AI Understanding	Sentiment, intent detection, topic clustering, revenue impact tagging	Transforms noise into structured signals
Action Intelligence	Priority queue by revenue impact, AI replies, bulk actions	Answers 'what do I do today?' not just 'what are people saying?'
Market Intelligence	Competitor review analysis, market gap detection, trend tracking	Turns competitors' reviews into your strategic advantage
Revenue Intelligence	Revenue impact correlation, lost revenue estimation, uplift modelling	Connects product decisions directly to business outcomes

DESIGN

05 Key UX & Product Decisions

Every design decision in the wireframe was deliberate. The five choices that most shaped the final product:

1. Action Center above the fold

Revenue-impacting issues needed to be the first thing a brand owner acts on. Putting Voice Feed first would bury urgency inside a feed of mixed-signal reviews.

2. Three-layer filtering in Voice Feed

Sentiment alone is too blunt. Added Impact (Revenue Risk / Opportunity / Growth) and Topic (Delivery, Quality, Size, Packaging) — so owners slice by what they actually need to act on.

3. Revenue-first language throughout

Avoided 'AI analysis' and 'model output' in all UI copy. Brand owners speak in business terms. Every metric maps to a business outcome: conversion, returns, revenue.

4. MVP scope discipline

Resisted adding an Experiment Engine, automated alerts, and improvement suggestions at V1. Powerful ideas — but would overload first-time users. Flagged as V2 features.

5. Warm earthy palette, not corporate blue

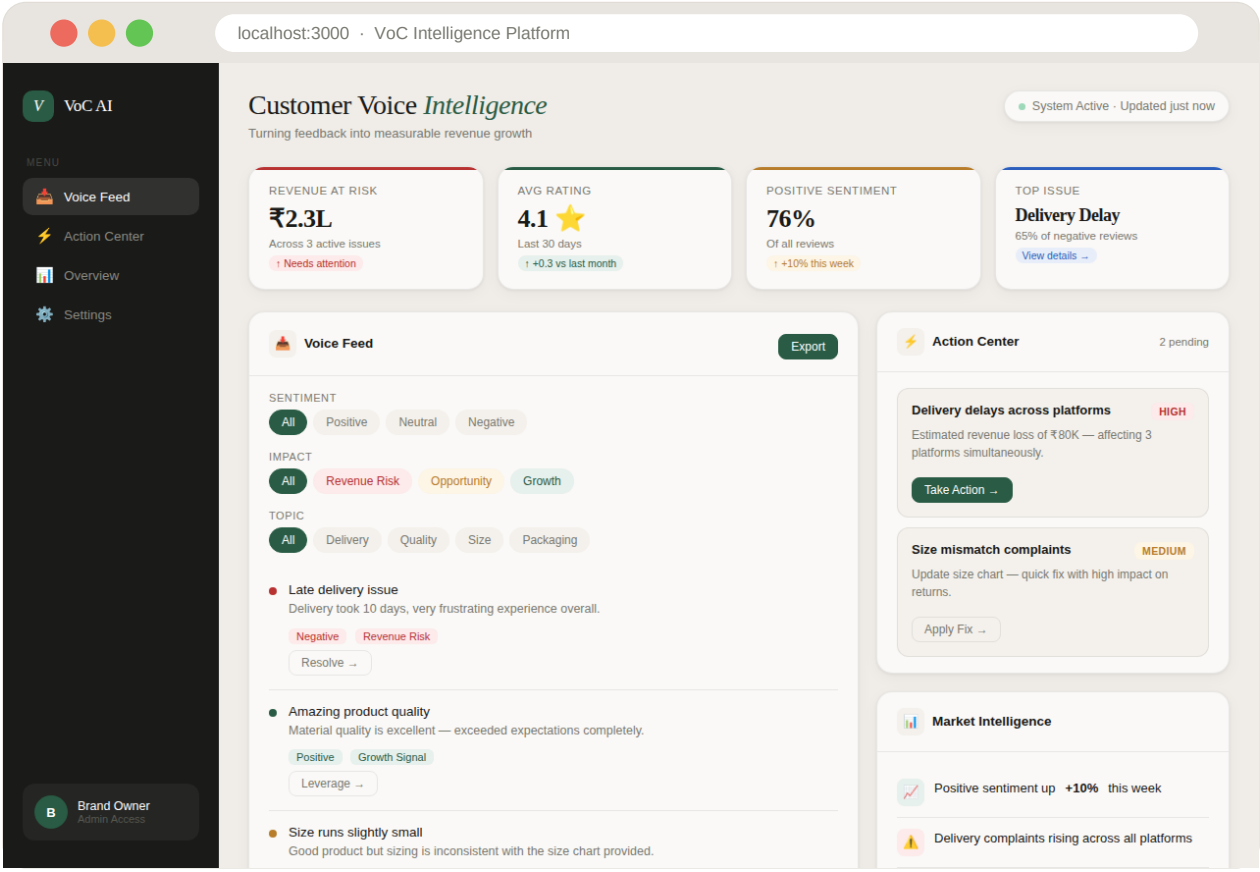
Forest green, burnt orange, warm stone — chosen to feel calm and premium, like a smart business partner rather than a cold analytics dashboard.

OUTPUT

06 The Wireframe — Platform UI

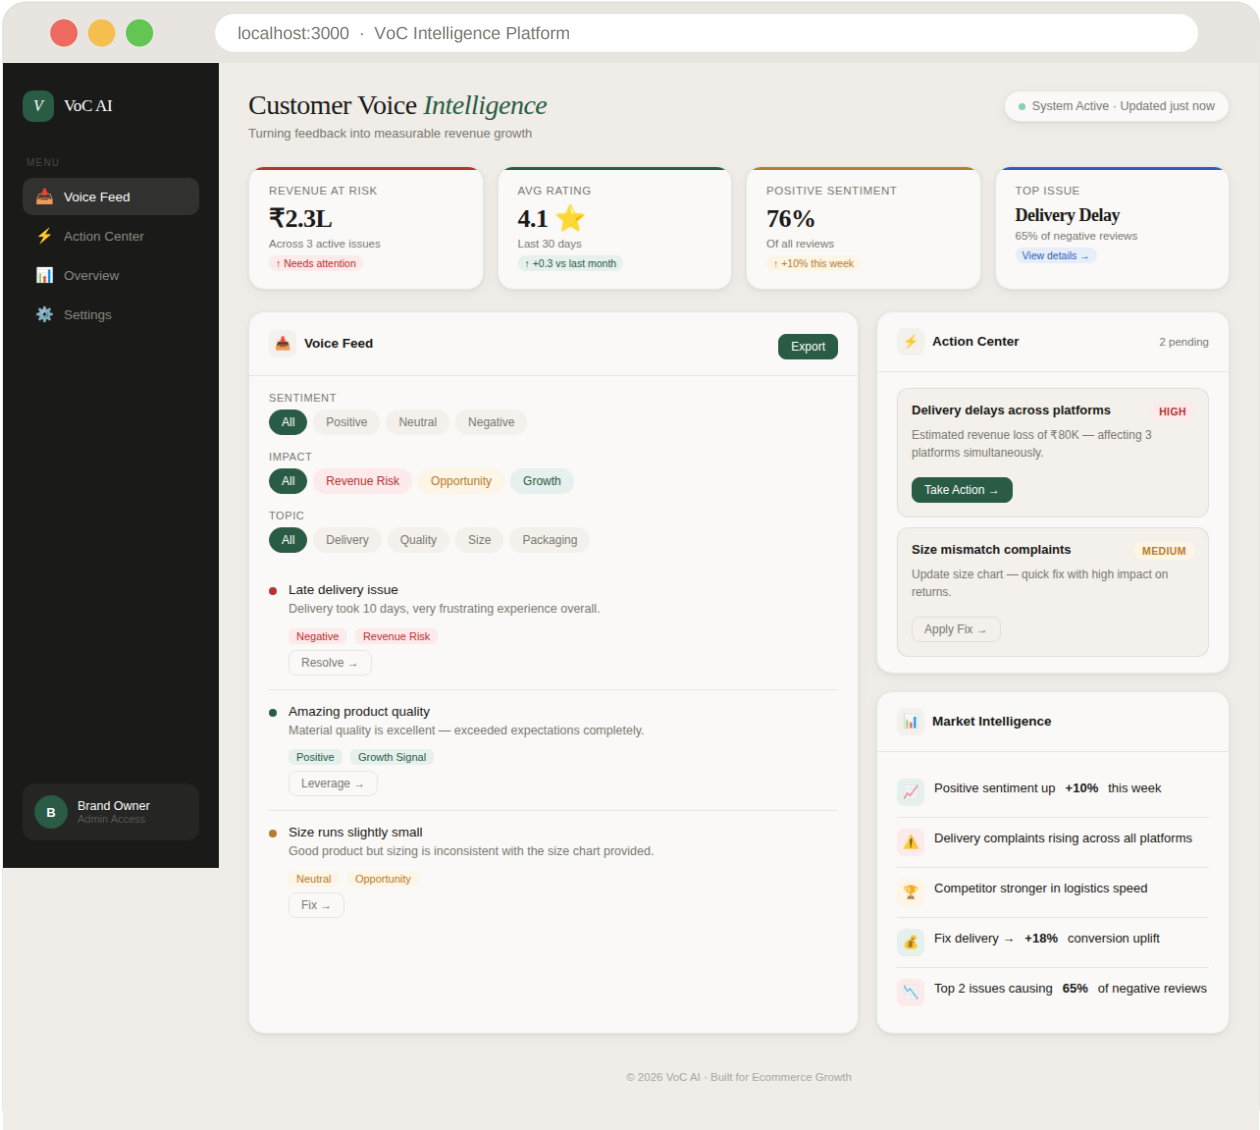
The final deliverable is a working HTML wireframe with interactive filter chips. Below is the actual platform as built — not a mockup description, but the real output.

Above the fold — first screen a brand owner sees



The layout immediately surfaces what matters: revenue at risk (₹2.3L), average rating, sentiment score, and the top issue — all before the user scrolls.

Full platform view — complete dashboard



The Market Intelligence panel at the bottom converts raw review data into five actionable business signals — from competitor gaps to conversion uplift estimates.

STRUCTURE

07 Dashboard Structure Breakdown

Every section was designed with a clear intent:

Section	What's There	Design Intent
Sidebar	Brand mark, 4 nav links, user avatar	Always-visible orientation — no hamburger menus
Topbar	Page title, subtitle, live system status pill	Reassures the owner the system is actively monitoring
KPI Cards	Revenue Impact, Avg Rating, Sentiment %, Top Issue	4 numbers that answer 'how am I doing?' in one glance
Voice Feed	Sentiment + Impact + Topic filters, 3 tagged sample reviews	Multi-axis slicing so owners find the right reviews instantly
Action Center	2 priority items with impact badges and CTA buttons	Decision prompt — not just information, but a call to act
Market Intelligence	5 insight cards: trends, competitor gaps, revenue uplift estimates	Strategic layer — answers 'where do I go from here?'

ROADMAP

08 What I'd Build Next

V1 is focused. Here's what a V2 roadmap looks like, prioritised by user value:

Feature	Value	Effort	Priority
Real API integration (Amazon SP-API)	Critical	High	V2
AI response suggestion engine	High	Medium	V2
Competitor review scraping	High	High	V2
Internal team alerting (Slack/email)	Medium	Low	V2
Experiment engine (test and measure)	Medium	High	V3

TAKEAWAYS

09 Reflection

What this assignment confirmed for me as a PM thinker:

- The most valuable product insight is usually a reframe, not a feature.
- Scope discipline is a product skill — knowing what NOT to build at V1 is as important as knowing what to build.
- Language is product design. 'Revenue Risk' vs 'Negative Review' changes how a user thinks and acts.
- UI hierarchy communicates product values. What you put first tells users what you think matters.

This is a wireframe — not a shipped product. But the thinking behind it is the same thinking I'd bring to a real product team.
